(57) **ABSTRACT**

A metal locking tie and support clip for securing a bundle are disclosed. The metal locking tie is positioned within the support clip. The metal locking tie has a tie head and a tie body. The tie head includes a locking ball and a bottom with an opening. The tie body includes a first end and a second end with cut-off edges. The support clip supports the bottom of the tie head and encapsulates the cut-off edges of the second end of the tie body.

EXTENDED SUPPORT CLIP FOR A METAL LOCKING TIE

CROSS REFERENCE TO RELATED APPLICATIONS

This application claims priority to U.S. Provisional Application No. 61/819,940, filed May 6, 2013, the subject matter of which is hereby incorporated by reference in its entirety.

FIELD OF THE INVENTION

The present invention relates to a metal locking tie, and more particularly, to an extended support clip for a metal locking tie.

BACKGROUND OF THE INVENTION

FIG. 1 illustrates a metal locking tie **10** with a typical tie body cut-off **24**. The end of the tie body **22** is cut-off flush with the tie head **12**. As a result, the sharp edges of the tie body cut-off **24** are positioned within the tie head **12**.

FIG. 2 illustrates an alternative metal locking tie with an extended tie body cut-off **26**. The sharp edges of the extended tie body cut-off **26** are exposed outside of the tie head **12**. The exposed sharp edges could potentially injure the installer or anyone who might come into contact with the metal locking tie head **12**.

As a result, it would be desirable to provide a cover for the exposed extended tie body cut-off edges to prevent injury to the end user.

SUMMARY OF THE INVENTION

The present invention is directed to a metal locking tie and a support clip. The metal locking tie is positioned within the support clip. The metal locking tie includes a tie head and a tie body. The tie head has a locking ball and a bottom with an opening. The tie body includes a first end and a second end with cut-off edges. The support clip encapsulates the cut-off edges of the second end of the tie body thereby preventing injury to the end user.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a partial perspective view of a metal locking tie with a standard tie body cut-off.

FIG. 2 is a partial perspective view of a metal locking tie with an extended tie body cut-off.

FIG. 3 is a perspective view of an extended support clip of the present invention for a metal locking tie.

FIG. 4 is a partial perspective view of the extended support clip of FIG. 3 installed on the metal locking tie.

FIG. 5 is a cross sectional view of the support clip of FIG. 3 installed on the metal locking tie of FIG. 2.

DETAILED DESCRIPTION

A metal locking tie **10** with an extended tie body cut-off **26** is necessary in applications where the metal locking tie **10** is applied over a rigid or non-compliant bundle. Once the metal locking tie **10** has been installed around the bundle, an installation tool cuts the tie body **22** at a second end **25** of the tie body **22**. The tie body **22** pulls back into the tie head **12** with great speed. As a result, the locking ball **14** (see FIG. 5) in the tie head **12** requires additional tie body **22** length to compensate for the loss of the pulled back tie body before

2

the locking ball **14** can gain the friction necessary to move into location and lock the metal locking tie.

FIG. 3 illustrates the support clip **50** of the present invention. The support clip **50** is designed to fit over a metal locking tie head **12** and a first end **23** of the tie body **22** of the metal locking tie **10**, as illustrated in FIGS. 4 and 5. The support clip **50** may also be retrofitted on a metal locking tie **10** that has already been installed on a bundle. The support clip **50** improves the metal locking tie's tensile strength performance by providing additional rigid support to the bottom of the metal locking tie head **12**.

The support clip **50** includes a bottom **52** with two C-shaped side arms **54** extending upwardly from the bottom **52** towards a center of the support clip **50**. A dimple **56** extends from the bottom **52** of the support clip **50**. The dimple **56** fits into a metal locking tie retention feature or opening **16** (see FIG. 5) to hold the support clip **50** in place in case of shock or vibration of the metal locking tie **10**. A tensioning head support shear form **58** also extends from the bottom of the support clip **50**. The shear form **58** extends upwards at an angle with respect to the bottom **52** of the support clip **50** to provide resistance to the tie head **12** during installation and tensioning of the metal locking tie **10**.

As illustrated in FIGS. 4 and 5, the support clip **50** encapsulates the sharp edges of the tie body cut-off **26**. The support clip **50** holds the tie body cut-off **26** in position during installation. Thus, the metal locking tie **10** with an extended support clip **50** enables the tie body cut-off **26** to be extended thereby providing the additional tie body length to properly seat the locking ball **14** within the tie head **12**.

Furthermore, while the particular preferred embodiments of the present invention have been shown and described, it will be obvious to those skilled in the art that changes and modifications may be made without departing from the teaching of the invention. The matter set forth in the foregoing description and accompanying drawings is offered by way of illustration only and not as limitation. The actual scope of the invention is intended to be defined in the following claims when viewed in their proper perspective based on the prior art.

The invention claimed is:

1. An assembly for securing a bundle, the assembly comprising:

a metal locking tie having a tie head and a tie body, wherein the tie head including a locking ball and a locking tie retention member, and wherein the tie body including a first end located in the tie head and a second end with cut-off edges located outside the tie head; and
a support clip secured to the metal locking tie, wherein the support clip fits over a bottom of the tie head and the first end of the tie body with a bottom of the support clip engaging the first end of the tie, and wherein the support clip encapsulates the cut-off edges of the second end of the tie body.

2. The assembly of claim 1, wherein the support clip includes two C-shaped side arms extending upwardly from the bottom towards a center of the support clip.

3. The assembly of claim 1, wherein the support clip includes a dimple extending from the bottom of the support clip, the dimple engages the locking tie retention member in the tie head to maintain the support clip in a stationary position.

4. The assembly of claim 1, wherein the support clip having a shear form extending from the bottom of the support clip, the shear form extending upwards at an angle to provide resistance to the tie head during installation and tensioning of the metal locking tie.
